

## Features & Options

- New BAPI-Stat “Quantum Prime” Enclosure Style
- VOC Alone or Temperature and Humidity Combination
- Achieves True Indoor Air Quality, Not Just CO<sub>2</sub> Dilution
- Output is Correlated to a CO<sub>2</sub> Value Allowing You to Ventilate Using ASHRAE’s CO<sub>2</sub>-Based VRP Algorithm

Humans respire Volatile Organic Compounds (VOCs) as well as CO<sub>2</sub>. The BAPI sensor is able to measure these VOCs and indicate when a space is occupied just as well as a CO<sub>2</sub> sensor.

The advantage of the VOC sensor is that it measures air contaminants from other sources besides respiration, such as building materials, cleaners, perfumes and furniture and carpet off-gassing. Using this sensor for Demand Controlled Ventilation then is a way of achieving true indoor air quality, rather than just CO<sub>2</sub> dilution.

A further benefit is that it requires no additional work on your part. That’s because the sensor converts the VOC reading to a CO<sub>2</sub> equivalent level. This lets you use ASHRAE’s CO<sub>2</sub>-based VRP schedule to ventilate.

The new BAPI-Stat “Quantum Prime” unit is available as a VOC sensor alone or as a combination temperature and humidity sensor. The optional display alternates between the measured values and is field adjustable between °F or °C. The VOC level is indicated as “Good, Fair or Poor” by three discrete green, yellow and red LED’s on the front of the unit. The red LED will begin to flash when the unit exceeds 2,000ppm, indicating that fresh air needs to be brought in.
